

Climate Change Update

The global climate system is under ever-increasing pressure from human activities, and our planet's feedback mechanisms are now beginning to accelerate those changes.

We invite you to an illustrated talk by Joe Botting on recent developments in understanding climate change particularly regarding the state of the Arctic sea ice. You'll hear both about the latest predictions ... and about those things that even the experts can't yet predict.

7.00pm, Tuesday 23rd August
Herb Garden Café
Free entry and refreshments

Climate Change update: What to expect from the coming decade

7.00pm, Tuesday 23rd August at the Herb Garden Café

The global climate system is under ever-increasing pressure from human activities and internal feedbacks are now beginning to accelerate the changes.

This is particularly true in the critical area of the Arctic. In 2012 northern sea ice fell to a spectacular new record low leading to dire prognostications and predictions of imminent collapse.

Although the worst-case scenario hasn't yet happened, the trends are growing clearer with each year and the news isn't what you'd call comforting.

This talk is an update on climate change, particularly regarding the state of the Arctic, and discussing where the changes are heading. It will also try to address what we can expect over the coming decade... and what we simply don't know and can't yet predict.

About the speaker

Joe Botting is a Llandrindod-based palaeontologist and naturalist, with a long interest in environmental matters. He certainly isn't a professional climatologist, but has been closely following what is going on for some years.

Given the message from this talk, you might be surprised to hear that he's not naturally a pessimist.
